4

Dietary management of the condition should only be done under medical supervision.

Enzymes

Enzymes are proteins that facilitate various chemical reactions in the body. They are involved in the biosynthesis (anabolism) and the degradation (catabolism) of all the substances in the body. This is called metabolism.

Metylmalonyl-CoA mutase (MCM) is an enzyme that is necessary for the metabolism of the amino acids: valine, isoleucine, threonine and methionine.

In MMA, the activity of the MCM enzyme is decreased.

Supported by **ANUTRICIA** as a service to metabolic medicine Dietary management of the condition should only be done under medical supervision.

In order to function correctly, some enzymes cannot work without the help of vitamins called cofactors.

Methylmalonyl-CoA mutase (MCM) is such an enzyme.

Its cofactor is adenosyl-cobalamin = AdoCbl. It is produced from vitamin B_{12} .

Types of MMA

Enzyme is defective (mut⁰, mut⁻) Cofactor production is defective (e.g. CbIA, CbIB)

Enzyme activity is absent or decreased

Uptake, transportation, production of AdoCbl from vitamin B_{12} can be defective

Supported by **(NUTRICIA** as a service to metabolic medicine Dietary management of the condition should only be done under medical supervision. Written by: F. Hörster, S. Kölker & P. Burgard Reviewed & revised for North America by: S. van Calcar

Types of MMA

The activity of the enzyme methylmalonyl-CoA mutase is decreased in both cases

How can the different types of MMA be identified?

- By using vitamin B₁₂
- By means of laboratory tests of cultured skin cells
- By means of genetic tests

Various types of MMA differ in the severity of the disease and are managed with different methods

Supported by **ANUTRICIA** as a service to metabolic medicine Dietary management of the condition should only be done under medical supervision.

Pathogenesis

1. Toxic effects of organic acids

Supported by **NUTRICIA** as a service to metabolic medicine Dietary management of the condition should only be done under medical supervision.

Pathogenesis

2. Problems resulting from a carnitine deficit

Propionylcarnitine reduces the amount of carnitine in the body

The increased production of propionylcarnitine and its elimination in the urine reduces the amount of carnitine in the body.

Carnitine is important to assure a sufficient supply of energy to many organs to maintain their function.

Low amounts of carnitine concentration can reduce the production of energy.

Supported by **ANUTRICIA** as a service to metabolic medicine Dietary management of the condition should only be done under medical supervision.

Pathogenesis

3. Metabolic crises

The accumulation of propionyl-CoA, propionic acid compounds, ammonia and methylmalonic acid can be especially high during metabolic crises. The following situations can lead to a metabolic crisis in MMA:

• Febrile illnesses e.g. diarrhea, fever, infectious disease, etc.

- Vaccinations
- Surgery
- Malnutrition

In these situations catabolism develops

The term **"catabolism"** refers to the metabolic reactions leading to the breakdown of body tissues.

Propionyl-CoA, propionic acid compounds, ammonia and methylmalonic acid are produced from body proteins, especially the breakdown of muscle!

Supported by **ANUTRICIA** as a service to metabolic medicine Dietary management of the condition should only be done under medical supervision.

What are the symptoms of a metabolic crisis?

- Unusual tiredness, unresponsiveness
- Loss of appetite, vomiting
- Quick and deep breathing
- Seizures
- Movement disorders (the child cannot sit or stand anymore, becomes "floppy", develops abnormal movements)
- The child is very difficult to wake up or you cannot get him to wake up at all (coma)

It is critical that treatment be started immediately to prevent the patient's condition from deteriorating. Metabolic crises can be fatal.

Supported by **NUTRICIA** as a service to metabolic medicine Dietary management of the condition should only be done under medical supervision.

Catabolism in a newborn

In the first days of life, catabolism causes the degradation of body tissues. This can lead to a metabolic crisis with encephalopathy (brain involvement).

Symptoms:	poor sucking, vomiting, weak response to stimuli, muscle weakness, reduced movements, dehydration, deep breathing, neurological symptoms, coma
Laboratory tests:	ammonia, ketoacidosis, blood smear abnormalities
Management:	prompt detoxification

Developmental abnormalities

 Some children may have delayed development, abnormal psychomotor development and can develop various neurological symptoms

2. Children may **lose developmental skills** following a **metabolic crisis**. The risk of developmental abnormalities increase with the severity and number of metabolic crises.

Supported by **NUTRICIA** as a service to metabolic medicine Dietary management of the condition should only be done under medical supervision.

Various organs can be affected in MMA

In many patients with MMA, renal (kidney) failure develops gradually over time

Less commonly affected are the blood, pancreas, heart and eyes

Supported by **NUTRICIA** as a service to metabolic medicine Dietary management of the condition should only be done under medical supervision.

Treatment with vitamin B₁₂

Only possible for those with defective cofactor production

Supported by **INUTRICIA** as a service to metabolic medicine Dietary management of the condition should only be done under medical supervision. Written by: F. Hörster, S. Kölker & P. Burgard Reviewed & revised for North America by: S. van Calcar

Principles of Management = Diet

Diet management decreases intake of valine, isoleucine, methionine and threonine

Principles of management:

1. Low in natural protein food

Supported by **ANUTRICIA** as a service to metabolic medicine Dietary management of the condition should only be done under medical supervision. Written by: F. Hörster, S. Kölker & P. Burgard Reviewed & revised for North America by: S. van Calcar

Supported by **INUTRICIA** as a service to metabolic medicine Dietary management of the condition should only be done under medical supervision. Written by: F. Hörster, S. Kölker & P. Burgard Reviewed & revised for North America by: S. van Calcar

Principles of management:

3. Carnitine supplementation

replaced by giving a medication containing carnitine.

Supported by **ANUTRICIA** as a service to metabolic medicine Dietary management of the condition should only be done under medical supervision.

Principles of management: 4. Drugs

Supported by **NUTRICIA** as a service to metabolic medicine Dietary management of the condition should only be done under medical supervision. Written by: F. Hörster, S. Kölker & P. Burgard Reviewed & revised for North America by: S. van Calcar

Five management components

- 1. Diet low in natural protein + metabolic formula with all amino acids except valine, isoleucine, methionine and threonine
- 2. Carnitine supplementation
- 3. Vitamin B₁₂ (only in cases of defective cofactor production)
- 4. Antibiotics to reduce bacteria in the large intestine
- 5. Emergency management: Follow an emergency plan including prompt management during acute illness:
 - a) Decrease the amount of natural protein from food
 - b) Frequent carbohydrates-rich meals
 - c) Continue carnitine

d) If the patient's condition deteriorates, contact the metabolic clinic immediately for further directions. An ER visit may be necessary.

Important: All patients with PA need an emergency protocol and plans for emergency treatment at the nearest children's hospital

Supported by **ANUTRICIA** as a service to metabolic medicine Dietary management of the condition should only be done under medical supervision.

Chromosomes, Genes, Mutations

A chromosome is like a cookbook.

A gene is like a recipe in the cookbook.

A **mutation** is like an error in the recipe or even a complete lack of a recipe.

The **enzyme** methylmalonyl-CoA mutase (MCM) is produced constantly in the body following a specific recipe (**gene**). If the gene contains abnormal **mutations**, the **enzyme** cannot be properly produced.

Supported by **INUTRICIA** as a service to metabolic medicine Dietary management of the condition should only be done under medical supervision.

Inheritance of MMA

Both parents are carriers in autosomal-recessive inheritance

Supported by **EXAMPLE 1** As a service to metabolic medicine Dietary management of the condition should only be done under medical supervision.

Inheritance

There are 4 possible combinations for any child born to parents who are carriers

Supported by **ANUTRICIA** as a service to metabolic medicine Dietary management of the condition should only be done under medical supervision. Written by: F. Hörster, S. Kölker & P. Burgard Reviewed & revised for North America by: S. van Calcar

Summary

Optimal management

- 1. Diet low in natural protein + MMA formula
- 2. Early and effective management of metabolic crises
- 3. Pharmacological treatment with use of vitamin B₁₂ carnitine, antibiotics, benzoate

Follow-up

Laboratory tests Special tests: amino acids, acylcarnitines, carnitine, ammonia, organic acids Routine tests Physical development Neuropsychological tests Intelligence (IQ), motor patterns Brain imaging Ultrasound, MRI Renal function tests Cardiologic examination

Management results vary and may include:

- Developmental delay of various degree
- Neurological abnormalities of various degree (movement disorders, spasticity, dystonia)
- Epilepsy
- Abnormalities in brain MRI
- Renal failure
- Cardiomyopathy
